DETAILED ACTION

Allowable Subject Matter

1. Claims 16-22 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Claim 16 is allowable for claiming electric shears comprising a handle, an electric drive unit contained in the handle, and a cutter head arranged on a front end of the handle. The cutting unit comprising a stationary blade and an oscillating blade disposed above the stationary blade. The oscillating and stationary blade define a cutting plane there between that is inclined relative to a longitudinal axis of the handle. The stationary blade is arranged between the oscillating blade and the handle such that the electric drive unit is connected to the oscillating blade through an opening in the stationary blade.

Abraham (U.S. Publication No. 2002/0162226, or WIPO Publication No. WO0236314A1) teaches (see Figures 1-8) a hair-cutting machine (10) with a handle (20) that has a front end. A cutter head (50) is disposed on the front end of the handle (20). The cutter head has a stationary blade (55) and an oscillating blade (57) disposed above the stationary blade while the hair-cutting machine is disposed in an operating position where the handle (20) is held vertically and the front end of the handle is located below the rest of the handle (20). A cutting plane is formed by the cutting blades (55 and 57) and is capable of being inclined in relation to a longitudinal axis of the handle. In the operating position as described above the cutting plane can be inclined downward and to the left of the longitudinal axis of the handle (20). Abraham

Art Unit: 3724

further teaches that the inclination angle of the cutting plane is adjustable (see Figures 4-8) and therefore is inherently capable of having a positive inclination angle of 30 degrees between the cutting plane and the longitudinal axis of the handle. Furthermore, Figure 3 shows that the cutter head (50) is interchangeable, and Figures 5-8 show that a flat covering (handle portion of handle 20 to the left of reference numeral 57) is provided for the oscillating blade (57). Abraham fails to teach the oscillating blade being adjustable in relation to the stationary blade in a longitudinal direction of the cutting plane, and the stationary blade being between the oscillating blade and the handle such that the drive unit must go through an opening the stationary blade to connect to the oscillating blade.

Hildebrandt (German Patent No. 3310706 A1) teaches (Figure 2) that it is old and well known in the cutting art to provide adjustment means to adjust a moving the reciprocating cutting blade (16) in a longitudinal direction in relation to a cutting plane formed by the moving cutting blade (16) and the non-moving blade (17). Hildebrandt however fails to teach the stationary blade being between the oscillating blade and the handle such that the drive unit must go through an opening the stationary blade to connect to the oscillating blade.

While Abraham and Hildebrandt are considered combinable, neither reference teaches an opening in the stationary blade for the drive unit to pass through to oscillate the oscillating blade. However, It has been held previously that there would be no invention in the shifting the location of parts if the operation of the device would not thereby be modified. The added structure of the opening in the inner stationary blade

Art Unit: 3724

though provides a structure that is not readily apparent or obvious when shifting parts.

Adding the opening to the device of Abraham would be improper hindsight.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
